

Chapter 14 - Complex Integration

Selected Problem set 14.1

14.1 1, 5, 7, 11, 13, 23, 25

1-10 FIND THE PATH and sketch it.

1. $z(t) = (1 + \frac{1}{2}i)t$ ($2 \leq t \leq 5$)

$$z(2) = 2+i$$

$$z(3) = 3+1.5i$$

$$z(4) = 4+2i$$

$$z(5) = 5+2.5i$$

5. $z(t) = 3 - i + \sqrt{10}e^{-it}$ ($0 \leq t \leq 2\pi$)

$$z(t) = 3 - i + \sqrt{10} [\cos(t) + i \sin(t)]$$

$$z(0) = 3 + \sqrt{10} - i$$

$$z(\frac{\pi}{2}) = 3 - (1 + \sqrt{10})i$$

$$z(\pi) = (3 - \sqrt{10}) - i$$

$$z(\frac{3\pi}{2}) = 3 + (\sqrt{10} - 1)i$$

$$z(2\pi) = 3 + \sqrt{10} - i$$

7. $z(t) = 2 + 4e^{\pi it/2} \quad (0 \leq t \leq 2)$

$$e^{\frac{\pi t}{2} \cdot i} = \cos\left(\frac{\pi}{2}t\right) + i \sin\left(\frac{\pi}{2}t\right)$$

$$z(0) = 2 + 4(1 + 0i) = 6$$

$$z(1) = 2 + 4(0 + i) = 2 + 4i$$

$$z(2) = 2 + 4(-1 + 0i) = -2$$

11-20 FIND A PARAMETRIC REPRESENTATION

and sketch the path.

11. Segment from $(-1, 1)$ to $(1, 3)$

$$m = \frac{3-1}{1-(-1)} = 1$$

$$(-1+t, 1+t) \quad 0 \leq t \leq 2$$

13. Upper half of $|z - 2 + i| = 2$ from $(4, -1)$ to $(0, -1)$

$$z(t) = 2 - i + 2e^{it} \quad 0 \leq t \leq \pi$$

21-30 INTEGRATION

Integrate by the first method or state why it does not apply and use the second method. Show the details.

23. $\int_C e^z dz$, C the shortest path from πi to $2\pi i$

$C: z(t) = t\pi i \quad 1 \leq t \leq 2$

$\dot{z}(t) = \pi i$

$$\begin{aligned} \int_1^2 e^{t\pi i} \pi i dt \\ = \pi i \int_1^2 [\cos(t\pi) + i \sin(t\pi)] dt \\ = \pi i \left(0 + -\frac{2}{\pi} \cdot i \right) \\ = 2 \end{aligned}$$

$$\begin{aligned} e^z \Big|_{\pi i}^{2\pi i} \\ = e^{2\pi i} - e^{\pi i} \\ = 1 + 0i - (-1 + 0i) \\ = 2 \end{aligned}$$

Simply connected.
 \Rightarrow Apply theorem 1.
 which is simpler
 in calculation.

25. $\int_C z \exp(z^2) dz$, C from 1 along the axes to i

$C_1: z_1(t) = 1-t \quad 0 \leq t \leq 1$

$\dot{z}_1(t) = -1$

$C_2: z_2(t) = ti \quad 0 \leq t \leq 1$

$\dot{z}_2(t) = i$

$$\frac{1}{2} e^{z^2} \Big|_1^i = -\sinh 1$$

$$\begin{aligned} \int_C z \exp(z^2) &= \int_{C_1} z_1 \exp(z_1^2) + \int_{C_2} z_2 \exp(z_2^2) \\ &= \int_0^1 (1-t) \cdot e^{(1-t)^2} \cdot (-1) dt + \int_0^1 ti \cdot e^{(ti)^2} \cdot i dt \\ &= \int_0^1 (t-1) \cdot e^{(1-t)^2} - t \cdot e^{-t^2} dt = \underline{-\sinh 1} \end{aligned}$$
